11: Cipriani E-3 (1951-1955) 1966 AZ2 Andamans AZ2
Onges

the finger-tips and almost pink, with pale chocolate moons and yellowish-brown palms and soles. In the adults the nails and soles of the feet remain pale, the palms being a little darker. The head, and the visible buccal and nasal epithelia, were almost black, and the gums were pink, as was the inside of the lips, with dark petechiae, in adults very noticeable, at the base of the teeth and over the tongue and palate. The cheeks, however, were a reddish-brown, although the whole skin was already showing signs of darkening after twelve hours. Nasal cartilage was minimal, but that of the ears well-developed. The darkest area of skin were the forehead, eye sockets, lids, nipples and genitalia.

In general, therefore, the infant's skin was very slightly lighter than that of the adults, though before I could be sure of this I had to wash off the thick layer of ochre which is smeared over the unwashed infants immediately after birth. As the infants are extremely carefully protected from the sun by 'umbrella' hats made of lobed palm leaves, the darkening, which is complete by the end of the first year, is clearly biological and is not effected by tanning. As, however, the Onges interchange or 'adopt' children freely, it was impossible to carry out any proper colorimetric observations.

I saw no albinos in the Onges, usually fairly common in dark-skinned peoples. I saw several in Africa, with apparently normal parents. Some African peoples destroy albinos at birth as they do those with deformities, and the Andamanese may do the same, as I saw little congenital deformity (see, however, p. 46). Fear of being held responsible for disasters which befall the group carries great weight, and it is possible that the two cases of abnormality which I did see did not manifest symptoms at birth. Twins, however, are clearly (and gladly) accepted, so eager are the Onges to have children.

It was already clear in the infant that it would have the somatic characteristics common to all Negritos as regards the proportions of the body, the form and dimensions of the head, absence of prognathism, comparatively fine lips, nose and ears, black skin, and woolly hair, and would be well below 1·5 metres in height when fully grown. Above all, the Andamanese have a large forehead, very wide-angled jaw and large mouths, with the upper lips not invariably full, as in Negroes. Many Onges, in fact, have fine features,
